

1 Description

The RedRock™ RR131 Series is a magnetic switch with digital open drain output ideal for use in medical, industrial, automotive, and consumer applications. Based on patented Tunneling Magnetoresistance (TMR) technology with seamless CMOS integration, the RR131 is capable of multiple configurations of several parameters to enable applications like proximity sensing, limit switching, and level detection.

The RR131 features an available operate sensitivity of 30 G (0.3 mT) and omnipolar magnetic field response. It has the world's lowest average current drain (200 nA) for an active magnetic switch, as well as high operating temperature ranges from -40°C up to 125°C.

9.1 Application Circuit (SOT-23)

9.2 Application Circuit (LGA-4)

RR131 Application Circuit

With the open drain output, the system voltage can range up to $V_{dd} + 0.3V$. Please keep in mind the supply voltage to the RR131 must not exceed 3.6V. A decoupling capacitor between the supply voltage and ground is required with placement close to the magnetic sensor. A typical capacitor value of 1.0 μF will suffice.

16 Suggested Pb-Free Reflow Profile

- Notes:**
1. Fully compatible with standard no-lead solder profile, 260 °C for 30 seconds max (3 cycles max).
 2. Profile shown as example. Users are advised to develop their own board-level profile.
 3. Suggested Pb-free reflow profile derived from IPC/JEDEC J-STD-020E.
 4. Temperature tolerance: +0 °C, as measured at any point on the package or leads
 5. MSL rating of 1 (SOT-23-3 only) compatible with J-STD-020 or equivalent.
 6. MSL rating of 3 (LGA-4 only) compatible with J-STD-020 or equivalent.
 7. All temperatures refer to the center of the package, measured on the package body surface that is facing up during assembly reflow (e.g., live-bug). If parts are reflowed in other than the normal live bug assembly reflow orientation (i.e., dead-bug), Tp shall be within ± 2 °C of the live bug Tp and still meet the Tc requirements, otherwise, the profile shall be adjusted to achieve the latter. To accurately measure actual peak package body temperatures, refer to JEP140 for recommended thermocouple use.
 8. Reflow profiles in this document are for classification/preconditioning and are not meant to specify board assembly profiles. Actual board assembly profiles should be developed based on specific process needs and board designs and should not exceed the parameters in this table.
